

# SAML & SCIM Integration Setup

1. Configure SAML Federation: - In AWS IAM Identity Center, enable external IdP and download metadata. - In Microsoft Entra ID, create an Enterprise Application and configure with AWS metadata. - Map SAML claims: userPrincipalName → email, displayName → name, objectId → externalId. - Upload Entra metadata back to AWS IAM Identity Center.
2. Enable SCIM Provisioning: - In AWS IAM Identity Center, enable Automatic provisioning and copy SCIM URL + Token. - In Microsoft Entra ID, configure Provisioning with SCIM endpoint + token. - Map attributes (userPrincipalName → userName, givenName, surname, mail, groups).
3. Test End-to-End Flow: - Assign a test user in Entra. - Verify user is provisioned via SCIM into IAM Identity Center. - Log in as user, authenticate via Entra, and confirm AWS access.
